stayalert

staysafe

Create Mobile Application

1. Open the application
2. Stayalert : On / Off
3. Click On > start zone

If the distance between two devices or more than two devices is less than 1-meter, then mobile vibration (i.e. danger zone), otherwise you are in safe zone.

Vibration is only to alert people and maintain distance between them

stay alert stay safe

we can also implement this ..

- Use map – safe zone and danger zone area

- User location zone area.

- Mostly affected near by area.

- People track according to area that they follow safety or not (and we can identify area wise that where people follow instruction or not)

- User self identify : how many times break safety distance if more then 5 times alert to some safety instruction

- Every time on / off app : alert to wash your hand .

- Hearing the same thing over and over again becomes habit….. update every guidelines and instruction 3 times a day.

Safety In Our Hands

Just keep distance
